Shared Decision Making Aid for Heavy Menstrual Bleeding

Heavy Periods: What are my options?

This decision aid is designed for you to discuss with your health care professional and help reach a shared decision that works for you. It aims to help you answer three key questions about your healthcare:

- What are my options?
- What are the benefits and risks of each option for me?
- How can I get support from my healthcare professional to make a decision that is right for me?

Heavy menstrual bleeding (HMB) is excessive menstrual blood loss that affects your quality of life. It remains one of the most common reasons for seeing a gynaecologist, with 1 in 20 women aged between 30 and 49 years consulting their GP every year due to heavy periods or menstrual problems. If heavy periods are affecting your quality of life, you can be offered various treatment options. This document lists the possible benefits and risks of the options available to you for heavy periods. Some of the treatments listed here may not be suitable for you depending upon your individual circumstances. The aim of treatment is to improve your quality of life.

Your health care professional will ask you about your periods and any concerns you have. You may be offered an internal examination and further tests like hysteroscopy (where a small telescope is used to get a view inside your womb) and/or ultrasound scan to find the cause of heavy periods. Your health care professional will then discuss and document available treatment options to help you make a decision that is right for you considering your preferences, any other medical issues (like medical conditions, obesity, previous surgery etc.), whether you have fibroids (including size, number and location), polyps, any problems with your womb lining, adenomyosis and any other symptoms such as pressure and pain. If you try one treatment and it doesn’t work, you can try the other available options.

**YOUR OPTIONS INCLUDE:**

- Monitoring – Wait and see how things go without any active treatment. This can be either monitoring you carry out yourself or monitoring with a health care professional. You can consider opting for other available treatments at any stage.

- Hormonal treatment – Levonorgestrel-releasing intrauterine system e.g. Mirena® or hormone tablets like combined oral contraceptives or progestogens either in the form of tablets or a 3 monthly injection or implant.

- Non-hormonal treatment – tranexamic acid or nonsteroidal anti-inflammatory drugs (NSAIDs).

- Surgical treatment – endometrial ablation, uterine artery embolization, myomectomy or hysterectomy.
## MONITORING

<table>
<thead>
<tr>
<th>Option</th>
<th>Benefits</th>
<th>Possible side-effects/risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watchful waiting without any active treatment</td>
<td>No side effects</td>
<td>Heavy periods may affect quality of your life</td>
</tr>
<tr>
<td></td>
<td>You can choose alternative treatment option at any time.</td>
<td>Periods may get worse</td>
</tr>
<tr>
<td></td>
<td>Your periods will eventually stop-average age of menopause in the UK is 51.</td>
<td></td>
</tr>
</tbody>
</table>
If LNG-IUS is not suitable or you do not want it, treatment options to consider include:

**NON-HORMONAL TREATMENT:** These can be started while you are awaiting further tests and can be continued for as long as you wish if it helps you

<table>
<thead>
<tr>
<th>Options</th>
<th>Benefits</th>
<th>Possible side-effects/risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tranexamic acid</td>
<td>This is non-hormonal treatment, so it has none of the side-effects of hormones</td>
<td>Less common: indigestion; diarrhoea; headaches</td>
</tr>
<tr>
<td></td>
<td>Up to 58% reduction in total menstrual blood loss</td>
<td>Does not reduce length or pain of periods</td>
</tr>
<tr>
<td></td>
<td>Suitable for women trying to conceive as it does not affect your fertility</td>
<td>This is not a contraceptive.</td>
</tr>
<tr>
<td>Non-steroidal anti-inflammatory drugs (NSAIDs) e.g. ibuprofen and mefenamic acid.</td>
<td>Helps with period pain as well</td>
<td>Common: indigestion; diarrhoea.</td>
</tr>
<tr>
<td></td>
<td>Up to 50% reduction in total menstrual blood loss</td>
<td>Rare: worsening of asthma in sensitive individuals; peptic ulcers</td>
</tr>
<tr>
<td></td>
<td>Also suitable for women trying to conceive as it does not affect your fertility</td>
<td>This is not a contraceptive.</td>
</tr>
<tr>
<td></td>
<td>Reduces your body’s production of a substance linked to heavy periods</td>
<td></td>
</tr>
<tr>
<td>Tranexamic acid plus NSAIDs</td>
<td>May work better than the above medications taken on their own</td>
<td>Side effects: as for the individual medications.</td>
</tr>
</tbody>
</table>
### HORMONAL TREATMENT

<table>
<thead>
<tr>
<th>Options</th>
<th>Benefits</th>
<th>Possible side-effects/risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Combined oral contraceptive pills (COCs)</td>
<td>Helps with period pain. Up to 40% reduction in total menstrual blood loss</td>
<td>Common: mood change; headache; nausea; fluid retention; breast tenderness</td>
</tr>
<tr>
<td>Involves taking a tablet containing oestrogen and progestogen-- every day for three weeks, stopping for a week and then repeating.</td>
<td>It is an effective contraceptive It does not affect your fertility after you come off the pills.</td>
<td>Rare: blood clots in legs/lungs: risks increase with age and body weight Forgetting to take pills may cause irregular bleeding</td>
</tr>
<tr>
<td>Oral progestogen (Noresthisterone)</td>
<td>Up to 80% reduction in total menstrual blood loss in the long term</td>
<td>Common: weight gain; bloating; breast tenderness; headaches; acne (usually minor and transient)</td>
</tr>
<tr>
<td>Involves taking tablets orally 2 to 3 times a day from day 5-26 of your menstrual cycle (counting first day of your period as day 1) Helps thin the lining of the womb</td>
<td>It does not affect your fertility after you come off the pills.</td>
<td>Rare: depression This is not a contraceptive</td>
</tr>
<tr>
<td>Progestogens in the form of injection or implant used mainly for their contraceptive effects can also help reduce menstrual blood loss Long acting progestogens are either injected every 12 weeks, usually into the buttock or Implant into the arm that lasts for 3 years Thins the lining of the womb</td>
<td>Mainly used as an effective contraceptive Up to 50% reduction in menstrual blood loss Bleeding may stop completely in some women It does not affect your fertility in future. However, sometimes, it can take a while for periods to return and for you to be able to conceive after discontinuing progestogen injection or implant.</td>
<td>Common: weight gain; irregular bleeding; absence of periods; premenstrual symptoms Less common: osteoporosis (largely recovers after stopping treatment)</td>
</tr>
</tbody>
</table>
## SURGICAL TREATMENT

<table>
<thead>
<tr>
<th>Options</th>
<th>Benefits</th>
<th>Possible side-effects/risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endometrial ablation</td>
<td>Minimally invasive surgery</td>
<td>Common: vaginal discharge; irregular bleeding; increased period pain or cramping (even if no further bleeding); need for additional surgery:</td>
</tr>
<tr>
<td></td>
<td>Can be done in out-patient clinical settings if you prefer</td>
<td>Less common: infection</td>
</tr>
<tr>
<td></td>
<td>Considered to be the best surgical treatment for reducing blood loss in women with no fibroids</td>
<td>Rare: damage to womb (very rare with newer available techniques)</td>
</tr>
<tr>
<td></td>
<td>Saves/preserves the womb</td>
<td>If performed under general anaesthetic, there is a small added risk from the anaesthetic.</td>
</tr>
<tr>
<td></td>
<td>Novasure ablation seems to be more effective in reducing the blood loss compared to other ablation techniques with 9 out of 10 women experiencing significant reduction in blood loss &amp; about 5 in 10 women experiencing no bleeding at 12-month follow-up.</td>
<td>Is not a contraceptive, so you will be advised to use contraception as pregnancy after the procedure carries increased risks.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This is a permanent solution and cannot be reversed. It is not suitable if you want to consider pregnancy in future.</td>
</tr>
<tr>
<td>Uterine artery embolization (UAE)</td>
<td>Helps shrink the fibroids and reduce the bleeding</td>
<td>Common: persistent vaginal discharge; post-embolization syndrome – pain, nausea, vomiting, abdominal pain and fever</td>
</tr>
<tr>
<td></td>
<td>May be suitable for you if you wish to consider pregnancy in future</td>
<td>Less common: need for additional surgery; premature ovarian failure (1 to 2 in 100 women, particularly in women over 45 years old); haematoma</td>
</tr>
<tr>
<td>Myomectomy</td>
<td>Helps remove whole or part of the fibroids and reduce the bleeding</td>
<td>Major surgery</td>
</tr>
<tr>
<td></td>
<td>May be suitable for you if you wish to consider pregnancy in future</td>
<td>Less common: Bleeding, infection, adhesions, recurrence of fibroids, damage to womb, need for further surgery</td>
</tr>
</tbody>
</table>

- **Endometrial ablation**
  - Involves surgery to destroy the lining of the womb by a variety of methods:
    - Radiofrequency ablation (Novasure)
    - Thermal balloon endometrial ablation (TBEA)
  - Technique involves inserting a device into the womb through the vagina and cervix to destroy the lining with radiofrequency energy (Novasure) or heated fluid (Thermal balloon).
  - Can be done under local or general anaesthesia.

- **Uterine artery embolization (UAE)**
  - This involves blocking the blood supply to the fibroids causing them to shrink.
  - Treatment option to be considered depending upon the size (3ms or more), location and number of fibroids, and the severity of the symptoms.

- **Myomectomy**
  - Surgery to remove fibroids either through your vagina using a thin telescope, called a hysteroscope or through a cut in your abdomen (key hole or open surgery).
### Options

Hysterectomy (major surgery to remove the womb and/or neck of the womb) - this may be total hysterectomy (removal of womb and neck of the womb) or subtotal (removal of womb only, keeping the neck of the womb).

Hysterectomy is an option if:

- Other treatment options haven’t worked for you (unsuccessful) or
- Other treatment options are not deemed suitable for you e.g. due to presence of large fibroids or
- Heavy bleeding is significantly disrupting your life or
- You do not wish to try other treatment options
  
  and

- You fully understand the benefits and risks involved and
- You don’t want to keep your womb or to have a child in future

### Benefits

- Your periods stop permanently
- No need for further treatment for periods
- Contraception not needed.

### Possible side-effects/risks

- Major surgery
- Cannot be reversed and you cannot conceive after this
- Common: infection
- Less common: bleeding during surgery (more likely if you have fibroids when a hysterectomy is carried out): damage to other abdominal organs, such as the bladder or bowel;
- Can affect the way your bladder works (frequent passing of urine, urinary leakage)
- Can have a psychological effect on you and can affect your sexual feelings
- Rare: thrombosis (DVT and clot on the lung)
- Very rare: death

### Hysterectomy………

This involves surgery and hospital stay. It may be undertaken via

- Vaginal route
- Abdominal route – opening the tummy
- Laparoscopic route (key hole)

Depending upon your individual clinical situation and taking your preferences into consideration

If you or your specialist is considering removal of your ovaries, the potential risks and benefits should be fully discussed with you.

- Removal of ovaries at the time of hysterectomy: menopausal like symptoms and may need hormone replacement therapy
- Risk of early menopause even if your ovaries are not removed during hysterectomy
